Videofied is a totally wireless intrusion alarm that communicates a video of the intrusion over the GPRS system to a monitoring station or an MMS to a cell phone.

Videofied is available either as a complete system or as an upgrade to existing security systems in commercial and residential applications. Videofied is built around a wireless night vision camera integrated with a motion sensor (P-Cam).

An intruder trips an alarm and the camera takes a 10 second video of what caused the alarm - sending a 200K MPEG file to a monitoring station and/or an MMS to a cell phone.

The entire system is wireless and battery powered (4 year life in typical operation) and it can be installed in minutes with no mess.

Videofied brings video security to difficult applications such as construction sites, semi-trailers, shipping containers, and remote infrastructure.

Features

- Instant video security protects buildings, homes, and people.
- A 10 second video of what caused the alarm is sent to a monitoring station and/or a cell phone as an MMS

Benefits

- Improved security and reduced false alarms.
